

Node.js and npm

If you haven't installed Node.js and npm, follow these steps:

1. Go to [Node.js official website](#).
2. Choose the appropriate version (v18.18.2) for your OS and download it.
3. Run the installer and follow the installation process.

OR

Alternatively, install multiple Node.js using NVM [NodeWithNVM](#)

To verify the installation, open your terminal and run:

```
node -v  
npm -v
```

Python installation

1. You may have to install python, if not already installed.
2. Go to [Python 3.12 Release](#)
3. Run the installer and follow the installation process.

MySQL

Please view this link for a tutorial on MySQL Workbench: <https://www.w3resource.com/mysql/administration-tools/mysql-workbench-tutorial.php> [MySQL Workbench Tutorial](#)

1. Download the MySQL installer from [here](#).
2. Run the installer and follow the setup process.
3. After installation, start the MySQL server.
4. Create a database (schema) for the application and make a note of the credentials.
5. Click the local Instance MySQL80 to open the your local instance.

[Browse Docum](#)

MySQL Connections

Local instance MySQL80

 root

 localhost:3306

6. Click the Schema's tab on the lower left side of the Local instance "navigator" window.

7. Right click the white space of the Schema Window, and select "Create Schema".

8. Type in the your Schema name in the new window. Name it something easy to remember, and press apply. Note: it is a good idea to name this Schema "proof_buddy_development".

9. You can confirm your Schema was created, by looking under the Navigator Tab of Schemas, you should see your named Schema.

Note: Do not edit your schema such as adding tables or rows to tables. When you run the server for the first time, it will sync and populate your schema automatically.

10. Congratulations! You have successfully created a Schema for your database. Make note of any password you may have used, and the name of your Schema.

Note: It's recommended to use a client tool like MySQL Workbench for easier database management.

OR

For more information follow [W3 Schools](#) to install MySQL.

Setting up the Project

1. Clone the repository:

```
git clone https://github.com/MarkNisarg/proof-buddy.git
```

2. Navigate to the project directory:

```
cd proof-buddy
```

3. Checkout to stage branch:

```
git checkout stage
```

4. Install the required dependencies for the backend:

```
cd django_server  
pip install -r ./requirements.txt
```

5. Install the required dependencies for the client:

```
cd ..  
cd client  
npm install
```
